They support crossnetwork capabilities such as bulk provisioning across networks and internetwork AtoZ provisioning. You create a profile once within CMS and apply it across all targeted C7 networks to ensure consistency across large deployments. CMS supports the following C7 profiles. For descriptions of profile parameters, see Overview of Traffic Profiles. For descriptions of profile parameters, see ONT Profile Parameters. For additional information about video services, see the Calix C7 Video Services Guide. For additional information about data services, see the Calix C7 Broadband Data Services Guide. For more information, see the Calix Management System CMS Guide. Replacing the shelf includes moving the cards and fan tray from the current C7 shelf to the replacement shelf. Label all Telco, data, LAN, and digital line and trunk cables interfacing with the current C7 shelf. For information on configuring the PC to connect to the E1 port, see "Introducing Calix C7 iMS" in the Calix C7 Provisioning Guide. Alternatively, coordinate with central office or network operations center NOC staff to perform the management interface tasks during the replacement procedure using CMS. Follow standard ESD precautions. Always wear the provided ESD wristband to avoid damaging the electronic equipment. Plug the wristband cable into the ESD jack located inside the Calix C7 shelf door. Do not look into the open end of an optical fiber. Place all STSs, ports, and cards out of service. See Backing Up the System Database. Record the slot location of all cards on your current C7 shelf, including empty slots. Place all STSs, ports, and cards out of service. Shut down and power off your current C7 shelf by switching OFF the DC circuit breakers. Disconnect the power feed cables entering the current C7 shelf make sure they are clearly labeled for reinstallation. Disconnect all interface cables, including alarm and network interfaces make sure they are clearly labeled for reinstallation.<http://aries-avia.com/userfiles/fleck-2510-instruction-manual.xml>

Remove all components from the current C7 shelf. Place the cards in an antistatic bag or on an antistatic mat. If your system is mounted in a cabinet or rack, unbolt and remove the current C7 shelf from the rack frame. Install the new replacement C7 shelf into the rack or cabinet. Insert the fan tray from the original C7 shelf. Connect the power supplying the new C7 shelf and power on the new C7 shelf. Wait for the fan tray to complete its power up cycle typically 3 to 5 minutes. Verify that the front panel display reads INPUT VOLTAGE OK before continuing. Verify that the database is intact not N00. Note If the shelf comes up as N00, remove the RAP card and install the other standby RAP card instead. If the shelf still comes up as N00, then restore a backup database. From the iMS, make sure that all cards and slots are displayed. On the Navigation Tree, click the Shelf level. Click Shelf View. Check the shelf serial number displayed in the Shelf panel. Note You can also verify the shelf information through the center LCD screen on the fan tray. The node number, shelf serial number, and ID should be displayed. Repeat Step 15 to verify the system database. Install the remaining C7 cards into the new replacement shelf. Reinstall all interface cables, including alarm and network interfaces. Place the STSs, ports, and cards into service set Primary Service States to IS In Service. Ensure that traffic resumes properly. After you have verified that your replacement shelf is operating properly, package your original shelf in the shipping material your replacement shelf arrived in. Follow the RMA instructions for returning the original shelf. Contact the Technical Assistance Center TAC if you need any assistance. Discover everything Scribd has to offer, including

supports VDSL2 cards and the E348C, E548 and E548C products that supports the equivalent of the  
VDSL2 line cards. One E72 VDSL248 line card can be plugged into a Calix E72 shelf to create a  
compact, high. One E72 VDSL248 line card can be plugged into a Calix E72 shelf to create a  
compact, very high density DSL node, with Ethernet aggregation and transport, ideal for copper  
based delivery of IP services across the access network. This is not the case with the VDSL248  
Overlay line card, since it requires no backplane communication to a second card in the E72 same  
chassis. Both the RT and CO nodes are fully and only equipped with E72 VDSL248C line cards, while  
they could also use transport cards for example 10GE4 in the MCC to aggregate multiple ERPS rings  
or take advantage of longer range XFP optics. See the E7 Maintenance and Troubleshooting Guide  
for a procedure on VDSL2 Single Ended Line Test SELT that is is a DSL preprovisioning test tool  
used to assess the line capability prior to installing a modem at the customer premise. Configuration  
process The network uplink configuration process follows 1. The classofservice profile specifies the  
CoS profile queuing of packets.If the link speed is forced to a set value, txrx is the default.Note Node  
protection can be configured by using two E72 nodes on an ERPS ring.

See Configuring RSTP Settings for the RSTP parameters to apply to the nodes. Note The VLAN  
tagged frames are identified as having a tag by utilizing the Ethertype field.LAG interfaces and their  
association with E7 Ethernet ports can be created, deleted, and modified.All of the links in the LAG  
must terminate on the same card for RSTP to be supported.Note Node protection can be configured  
by using two E72 nodes on an ERPS ring. See Configuring RSTP Settings for the RSTP parameters  
to apply to the nodes. Description Descriptive name for the interface.Note The VLAN tagged frames  
are identified as having a tag by utilizing the Ethertype field.Note For ESeries Ethernet services, the  
ESeries only passes VLAN tags provisioned on an Edge or Access link interface.See Calix Quick Tip  
E7 QT12003 for more information. When enabled, an event is sent for. For example, VoIP or  
Management. 5. In the IGMP Mode list, select the IGMP mode. Calix recommends that VLANs used  
for video services be set to suppresssnoop or proxy enable snooping. The TR101 format will have a  
defining letter for the port followed by the port number, except for the VDSL ports which will be  
only the port number no leading letter v. See the Calix Open Link Cable vCMTS CommandLine  
Interface CLI Reference Guide and Calix Open Link Cable vCMTS SNMP Management Guide for  
more information. When you create a tagaction, the interface automatically becomes a member of  
the VLAN specified in the tagaction.It is not possible to have a burst size less than the MTU of the  
interface. See the Calix ESeries Engineering and Planning Guide for an example of an ESeries  
Ethernet interface tag action and an interface QoS policy being applied to an Ethernet interface. The  
E72, E548C, E548, and E348C support one VC assignment per service. The STag can be added by  
the service tag action. Add 2tags, or changeandadd tag action.The inner tag does not have to match  
a provisioned VLAN ID.

In turn, the policy map is associated with an ESeries Ethernet port interface.See the Calix ESeries  
Engineering and Planning Guide for an example of an ESeries Ethernet interface tag action and an  
interface QoS policy being applied to an Ethernet interface. The upstream traffic on a service VLAN

must have the same priority value as is set for downstream traffic. To create an IP precedence profile 1. The following diagram shows two variations of this model One highspeeddata VLAN carrying both HSI and unicast video left node and separate VLANs for data and unicast video right node. See Configuring IP video Services for instructions. Note By default, IGMP snooping is disabled on a VLAN. IGMP snooping should only be enabled for VLANs that carry multicast content. Typically one, but sometimes a few VLANs are utilized to distribute multicast content within the access network. The system sends IGMPv2 QUERIES towards the subscriber. Each time the interface receives a v2 message from the subscriber, the timer is refreshed. Applying multiple DSL templates to a single port Each DSL template may specify some or all of the xDSL port parameters. Ethernet GoS Profile Index of Ethernet GOS profile to use. Interleave Max Latency Downstream or upstream interleave maximum latency msec. Allows VDSL2 to coexist in the same binder as VDSL1 QAM. Note See Calix xDSL Best Practices for a description of the physical layer factors that may directly influence the quality of data and video services delivery, and recommendations for the best practices necessary to achieve optimal results. Also, the ESeries provides a default Calix format syntax and a TR101 format that complies to TR101 R124 requirements. Proprietary Information Not for use or disclosure except by written agreement with Calix. The TR101 format will have a defining letter for the port followed by the port number, except for the VDSL ports which will be only the port number no leading letter v.

Security Profile Name of the Security Profile to use. For details, see the Calix C7 VoIP Services Guide. For details, see the Calix C7 VoIP Services Guide. If you use CMS to provision a C7 TDM Gateway service, you can specify the CSIP VCG in a TDM Gateway Service Group that is referenced when you activate the service. Assuming that the updated system software has all of the necessary coefficient settings builtin, the previously applied coefficient files would be obsolete. This model is often referred to as N1. Proprietary Information Not for use or disclosure except by written agreement with Calix. For IPTV, Calix recommends enabling power cutback by setting maximum SNR margin to 16 dB for both upstream and downstream directions. Note For instructions to configure the C7 TDM voice gateway, refer to the Calix C7 VoIP Services Guide. The specified CRV must be entered in upper case as shown above. Calix ESeries platforms. Calix E7 User Guide. Writing About Writing Wardle Ebook. I have a Calix C7 chassis that im trying to setup to learn more about DSL and GPON in particular. Right now I have the chassis, fantray, RAP10GE, ATP, and AMP card. Everything is booted up and im able to telnet into the box and issue TL1 commands and use the java based web GUI. The issue im having now is with a DSL line card, a Combo 24V.

I cant seem to get the card inservice to configure the DSL ports. The error is Image not available when im in the GUI. Epson Workforce 610 Wireless Printer Driver. Just a long shot, but anyone have any experience with the Calix C7 chassis and would be willing to explain just a few basics about the platform. Directly from the C7 Tshoot guide EQPTIMGUNAVAIL Equipment Image Not Available This alarm is raised when a card is inserted in a C7 shelf but no image exists for it in the network. Recommended action 1. Check for and troubleshoot any of the FTPrelated alarms FTPDOWN, FTPNOTPROV, FTPNOTREADY, FTPRELBADFILES, and FTPRELMISSING. If needed, run the CUP Push Release to FTP Server utility to transfer the C7 release files to the FTP server. Refer to the Calix C7 Maintenance Guide for instructions. Severity Minor, Nonserviceaffecting I know that wont help a ton, but looks like you need have an FTP issue that the C7 cant reach to load the firmware for

that card. Usually it'll pull it if it's loaded onto the AMP card, if memory recalls, if not loaded there then it goes to the FTP to find it. I can find more if that doesn't help. I'm just using the basic iMS GUI to configure the box. I don't have access to the CMS system unfortunately. It seems that the issue is what you guys are saying, the image for the Combo24V card is not on the ATP card which means it's looking out for FTP. I setup the FTP on the C7 chassis to point to another computer on the network. At this point I think I'm stuck since I don't have the release images for the Combo24V card, would anyone have any idea how to obtain those. I don't have the CUP available to me. Does anyone know how I would go about obtaining the CUP files. I can't find them anywhere on Calix's site.
